

1 **ADJUSTABLE AUXILIARY APPARATUS OF STABLE AIR**
2 **CONDITIONING FOR HUMAN RESPIRATORY SYSTEM**

3 **BACKGROUND OF THE INVENTION**

4 1. Field of the Invention

5 The present invention relates to a medical appliance related field, and
6 more particularly to an air conditioning and regulation apparatus that provide
7 purified air at proper levels of temperature, pressure and humidity for a person
8 whose respiratory system may be defective.

9 2. Description of Related Art

10 The ambient air that we breathe everyday contains many contaminants,
11 such as toxic particles, bacterium and allergenic substances. A person who has
12 chronic pulmonary diseases particularly needs clean and fresh air to breathe. In
13 addition to the requirements of purified air, adequate levels of air temperature
14 and humidity must be controlled to maintain the air conditions in an optimized
15 state to meet demands of air exchanging in alveoli, especially in a compromised
16 respiratory system of the pulmonary diseased person. Conventional air
17 conditioners do not have a combined function of cleaning the air and regulating
18 simultaneously certain levels of the air and are thus not able to provide a suitable
19 atmospheric condition for people in general and those suffering pulmonary
20 diseases, such as upper or lower airway related diseases in particular.

21 Therefore, the present invention provides an air conditioning and
22 regulation apparatus for pulmonary diseased persons to address the
23 aforementioned problems so as to reduce stress of the respiratory system of a
24 diseased person and avoid a further injure in respiratory passage, such as trachea

1 and bronchus.

2 SUMMARY OF THE INVENTION

3 The main objective of the invention is to provide an improved air
4 conditioning and regulation apparatus that removes contaminating particles and
5 odors from the air and regulates the clean air to desired levels of temperature,
6 pressure and humidity.

7 The present invention mainly comprises an air treatment assembly and a
8 host controlling assembly. The air treatment assembly comprises an air filter, a
9 humidity control and a heating device for temperature control. The air filter
10 removes the particles and smells from the air. The clean air is regulated and
11 conditioned by the three aforesaid controls that hold the clean air to desired
12 levels of temperature, pressure and humidity.

13 The host controlling assembly controls and actuates the air treatment
14 assembly to achieve the aforesaid goal that is to provide clean, fresh and
15 comfortable air for the pulmonary diseased person to breathe.

16 Other objectives, advantages and novel features of the invention will
17 become more apparent from the following detailed description when taken in
18 conjunction with the accompanying drawings.

19 BRIEF DESCRIPTION OF THE DRAWINGS

20 Fig. 1 is an enlarged perspective view of a preferred embodiment in
21 accordance with the present invention;

22 Fig. 2 is an enlarged top plan view of the preferred embodiment in Fig. 1;

23 Fig. 3 is an enlarged side elevation plan view of the preferred
24 embodiment in Fig. 1;

1 Fig. 4 is an enlarged perspective view of an air filter in a filter case of the
2 preferred embodiment in Fig. 1;

3 Fig. 5 is an enlarged, exploded perspective view of the air filter in Fig. 4;

4 Fig. 6 is an exploded perspective view of a segment of a clean air venting
5 hose of the preferred embodiment; and

6 Fig. 7 is an operational perspective view of the preferred embodiment in
7 Fig. 1, when the preferred embodiment of the present invention is used beside a
8 sickbed.

9 DETAILED DESCRIPTION OF PREFERRED EMBODIMENT

10 With reference to Figs. 1 to 4 and 7, a preferred embodiment of the
11 present invention comprises a platform (10), an air treatment assembly (20), a
12 host controlling assembly (30) and a display (40). The air treatment assembly
13 (20) is mounted in the platform (10) to treat and clean air. The host controlling
14 assembly (30) controls and actuates the air treatment assembly (20) to maintain
15 adequate levels of air temperature and humidity of clean air. The platform (10)
16 has a front (not numbered), a rear (not numbered), a top (not numbered), a
17 bottom (not numbered), a left side (not numbered), a right side (not numbered), a
18 channel (101) and a filter case (102). The channel (101) is defined transversally
19 in the top and is elongated from the left side to the right side. The filter case (102)
20 is mounted in the platform (10) at the right side and protrudes partially into the
21 channel (101). The filter case (102) has an intake air entrance (103) and an air
22 exit (104) that are formed opposite to each other.

23 The air treatment assembly (20) is mounted in the platform (10) to
24 condition and regulate the incoming air and comprises an air duct (21), an air

1 filter (22), a humidity control (23), a heating device (24), an optional ozone
2 generator (25), a water vapor generator (26) and a clean air venting hose (27).
3 With further reference to Figs. 4 and 5, the air filter (22) is mounted in the filter
4 case (102) and comprises a housing (221), a filtering core (222) and a powered
5 fan (223). The housing (221) is mounted in the filter case (102) and has an air
6 inlet (224) and an air outlet (225). The air outlet (225) is aligned with the air exit
7 (104) of the filter case (102). The filtering core (222) is mounted in the housing
8 (221) to remove the particle contaminants from the incoming air. The powered
9 fan (223) is driven by a motor (not shown) and is mounted in the filtering core
10 (222) to draw the air that passes through the intake air entrance (103) of the filter
11 case (102) to pass through the filtering core (222). The filtering core (222)
12 removes the contaminants, such as particles, odorous substances and the like
13 from the air.

14 The filtering core (222) of the air filter (22) may comprise an inside
15 filtering cage (226), an outside filtering cage (227) and a filtering fine mesh
16 (228). The inside filtering cage (226) is porous, is mounted inside the outside
17 filtering cage (227) and has a smell adsorption mixture of active carbon,
18 potassium permanganate, zeolite etc to adsorb odors from the incoming air. The
19 outside filtering cage (227) is also porous and is made of a fabric of irregular
20 fiberglass and fiber to remove the particles that are less than a diameter of 0.3
21 microns. The filtering fine mesh (228) wraps radially around the outside filtering
22 cage (227), contains active carbon and is used to remove the particles that are
23 larger than a diameter of 0.3 microns.

24 With reference to Figs. 2, 3 and 5, the air duct (21) is transparent, is

1 mounted in the channel (101) and has a transverse segment (211), a vertical
2 segment (212) an interior periphery (not numbered), an exterior periphery (not
3 numbered), a narrowed end (not numbered) and a top end (not numbered). The
4 transverse segment (211) is tapered. The narrowed end is formed at the
5 transverse segment (211) and is fitted and held in the aligned air exit (104) and
6 air outlet (225). The top end is formed in the vertical segment (212). The interior
7 periphery of the air duct (21) is provided with a layer of thin film of photo
8 catalysis, such as titanium dioxide (TiO_2). Therefore, the bacterium or virus will
9 be killed by the photo catalysis as the air passes through the air duct (21) as light
10 transmits through the air duct (21).

11 The humidity control (23) is mounted in the platform (10) and comprises
12 a condenser (231), a condenser controller (232), a drain pan (233) and a drain
13 hose (234). The condenser (231) is mounted on the exterior periphery of the
14 transverse segment (211) and is controlled by the condenser controller (232).
15 The drain pan (223) is mounted on the bottom of the platform (10) to collect
16 condensed water. The drain hose (234) is attached to the exterior periphery of the
17 transverse segment (211) at a position below the condenser (231) and has two
18 open ends (not numbered). The ends respectively extend into the transverse
19 segment (211) and the drain pan (233) to permit the condensed water to enter the
20 drain pan (233).

21 The heating device (24) is mounted in the platform (10) and comprises a
22 heater (241) and a heater controller (242). The heater (241) is mounted on the
23 exterior periphery of the transverse segment (211) at a position over the
24 condenser (231) and is controlled by the heater controller (242) to heat the air

1 that passes through the air duct (21).

2 The ozone generator (25) is mounted in the platform (10) and has a
3 connecting hose (252). The connecting hose (252) connects to the transverse
4 segment (211) so that ozone generated by the ozone generator (25) can enter the
5 transverse segment (211) through the connecting hose (252) to disinfect the
6 filtered air that comes out of the air filter (22).

7 The water vapor generator (26) is mounted on the platform (10),
8 connects to the air duct (21) and comprises a water vapor tank (261), a
9 supplementary water device (262), an ultrasonic generator (263) and a water
10 level controlling device (not numbered). The water vapor tank (261) has a top
11 (not numbered), a bottom (not numbered) and an inner space (not numbered).
12 The top end in the vertical segment (212) of the air duct (21) connects to the
13 water vapor tank (261) at the top of the water vapor tank (261). The water vapor
14 tank (261) contains the water in the inner space. The supplementary water device
15 can be two or more supplementary water tanks (264) and is attached to the left
16 side of the platform (10). The two supplementary water tanks (264)
17 communicate with the water vapor tank (261) at the bottom by means of a pipe
18 (not numbered). The water level controlling device comprises a water level
19 switch (267) and a flow control valve, such as an electromagnetic valve (268).
20 The water level switch (267) is attached to the water vapor tank (261) at a high of
21 5 to 8 centimeters and electrically connects to the electromagnetic valve (268).
22 The electromagnetic valve (268) controls the flow of water in the pipe to allow
23 the water in the supplementary water tanks (264) enter the water vapor tank (261)
24 as the water level switch (267) is triggered so as to keep the water in the water

1 vapor tank (261) at the given height. The ultrasonic generator (263) is mounted
2 at the bottom of the water vapor tank (261) to produce ultrasonic waves to
3 vibrate the water molecules in the water vapor tank (261) so that a small amount
4 of the water becomes water vapor filling the inner space. The moist inner space
5 is used to increase a degree of humidity in the air that passes through the water
6 vapor tank (261).

7 With further reference to Fig. 6, the clean air venting hose (27) is flexible
8 and connects to the water vapor tank (261) at the top of the water vapor tank
9 (261). The clean air venting hose (27) can be assembled of multiple separated
10 segments (271) and has a proximal end (not numbered), a distal end (not
11 numbered), a connector (272), a connecting duct (273) and a thermostat heating
12 coil (not numbered). The proximal end connects to the water vapor tank (261) at
13 the top. The connector (272) and the connecting duct (273) are respectively
14 formed at the distal end. The thermostat heating coil wraps around the clean air
15 venting hose (27) to hold the air temperature at a given level. The connecting
16 duct (273) is used to connect the air venting hose (27) to a facemask (274), a
17 tracheal cannula (not shown) or the like for providing the clean air to the person
18 who has the pulmonary disease.

19 The host controlling assembly (30) comprises a modular controlling
20 circuit board (31), multiple control knobs (35) and multiple sensing elements,
21 such as pressure sensors (32), humidity sensors (33) and temperature sensors
22 (34). The sensors (32, 33, 34) are respectively mounted on the transverse
23 segment (211) near the narrowed end and either the end of the connecting duct
24 (274) or the clean air venting hose (27) near the distal end. The modular

1 controlling circuit board (31) operates a servo control system and electrically
2 connects to the ozone generator (25), the controllers (232,242), the ultrasonic
3 generator (263) of the water vapor generator (26), the powered fan (223) and the
4 control knobs (35). Consequently, the modular controlling circuit board (31) can
5 control and actuate the condenser (231), the heater (241), the ozone generator
6 (25) and the water vapor generator (26) with an adequate timing.

7 The display (40), such as a liquid crystal display (LCD) monitor may be
8 mounted on the top of the platform (10), a separated tripod stand (not shown) or
9 on a bed (50) and electrically connects to the modular circuit board (31). The
10 display (40) can indicate the conditions of the air for care givers or users
11 themselves. A desired degree of temperature, pressure and humidity in the air
12 can be set by means of the control knobs (35) and start the fan (223). The air
13 filter (22) removes the contaminants and smells from the incoming air. The
14 purified air enters the air duct (21), and the sensors (32, 33, 34) detect the current
15 pressure, temperature and humidity in the purified air. If the humidity degree is
16 higher than the set value, then the humidity control (23) works to condense the
17 moist air. The condensed water will be collected in the drain pan (233). If the
18 humidity degree is lower than the set value, then the water vapor generator (26)
19 works to produce water vapor to moisten the purified air. Likewise, if the air
20 temperature is less than the set value, then the heating device (24) works to heat
21 the air. If the air temperature is higher than the set value, the humidity control (23)
22 works to cool the purified air. If the pressure of the air in the air duct (21) is
23 higher than the set value, then the revolution speed of the fan (223) is reduced. If
24 the pressure of the air in the air duct (21) is lower than the set value, then the

1 revolution speed of the fan (223) is increased.

2 Even though numerous characteristics and advantages of the present
3 invention have been set forth in the foregoing description, together with details
4 of the structure and function of the invention, the disclosure is illustrative only,
5 and changes may be made in detail, especially in matters of shape, size, and
6 arrangement of parts within the scope of the appended claims.
